

Albanian multimodal tail fiber

Summary of Content

Albania is developing a strategic multimodal fiber optic network, integrating subsea and terrestrial links to enhance digital connectivity across the Balkans and Mediterranean region.

Fiber Optic Infrastructure in Albania

Albania is investing heavily in high-capacity fiber optic networks to serve as a digital gateway between Europe and the Mediterranean. The Hungarian group 4iG, in cooperation with the Albanian government, is constructing a subsea cable system from Egypt to Albania, positioning the country as a strategic hub for international data traffic. This project includes a major data center in Durres and aims to support future technologies like 5G, while creating hundreds of jobs and strengthening Albania's telecommunications infrastructure . In addition to subsea links, Albania is expanding terrestrial fiber networks, including a high-capacity optical fiber link connecting Albania and Greece. This forms part of a Balkan-Mediterranean digital corridor, enabling faster and more reliable international data transmission and linking Albania to wider European networks . The Albanian Telecommunications Union (ATU) has also deployed over 450 km of fiber and more than 7 points of presence (PoPs) across major cities, establishing a robust national backbone .
