

Busbar above the high-voltage switchgear

Overview

A busbar is a metal bar, usually made of copper or aluminum, that carries electricity inside switchgear. It connects the incoming power to circuit breakers and outgoing circuits, helping power flow smoothly and evenly. Good busbar design helps prevent overheating and electrical. Busbar design in switchgear ensures safe, reliable power distribution by balancing current capacity, thermal performance, mechanical strength, insulation, and standards compliance. These busbars are not merely simple current conductors; they serve as the strategic backbone, interconnecting various components within the. To connect various high voltage (HV) components to the HV system, TE also delivers a wide variety of busbars. In cooperation with the customer, these can also feature TE's Bus Bar Insulation Tubing (BBIT). Busbars provide a safe HV connection on shorter distances. In the “childhood” of electricity no separate protection was used for the busbars.
