

Cable Joint Bridge

Overview

A cable-stayed bridge is a type of bridge that has one or more towers (or pylons), from which cables support the bridge deck. A distinctive feature are the cables or stays, which run directly from the tower to the deck, normally forming a fan-like pattern or a series of parallel lines. This is in contrast to the modern suspension bridge, where the cables supporting the deck are suspended vertically from the span. Span range: Medium to long. Material: Steel rope, post-tensioned concrete, or Movable. No Design effort: medium. History: Cable-stayed bridges date back to 1595, where designs were found in *Machinae Novae*, a book by Simon Stevin - inventor. Many early suspension bridges were partially cable-stayed in c. Cable-stayed bridges may appear to be similar to, but they are quite different in principle and construction. In suspension bridges, large main cables (normally two) hang between the towers and are.
