

# Caling from OLT to Optical Distribution Box

## Summary of Content

The OLT sends optical signals downstream through the optical distribution network, which are split and routed via optical distribution boxes to reach end-user ONUs/ONTs.

### Role of the OLT

The Optical Line Terminal (OLT) is located at the central office or service provider's access node and serves as the central management point for the PON (Passive Optical Network). It converts electrical signals into optical signals, manages bandwidth allocation, authenticates users, and controls upstream and downstream traffic to multiple end users . Each OLT port can serve multiple users through optical splitters, supporting both IP and traditional TDM services .

### Optical Distribution Network (ODN)

The ODN connects the OLT to end-user equipment (ONU/ONT) and consists of:

- Feeder fiber: Runs from the OLT or Optical Distribution Frame (ODF) to a distribution point.
- Optical splitters: Divide the optical signal to serve multiple users.
- Distribution fiber: Connects splitters to optical distribution boxes.
- Drop fiber: Runs from the optical distribution box to the user's ONT/ONU .
