

Can the KVM switcher split the screen

Summary of Content

Yes, certain KVM switches can split a single monitor to display multiple computers simultaneously using features like PiP, PbP, and multi-window layouts.

Split-Screen KVM Functionality

Some advanced KVM switches, such as the Rextron QSKEM-2814, allow users to operate multiple computers on a single monitor by providing split-screen modes including Picture-in-Picture (PiP), Picture-by-Picture (PbP), Full-View, and Quad-View. These switches can display video from 1, 2, or 4 computers simultaneously, with adjustable window size, position, and transparency, while maintaining the aspect ratio and resolution of each source. This enables seamless multitasking and monitoring of multiple systems on one display.

Limitations and Considerations

Not all KVM switches support split-screen functionality. Standard KVM switches typically allow switching between computers but only display one computer at a time on a single monitor. Attempting to use a simple HDMI splitter with a KVM will only mirror the same output across multiple monitors, not create a true split-screen setup. To achieve split-screen, you need a KVM specifically designed for multi-view or multi-window operation.
