

Common Installation Methods for Network Cabinets

Summary of Content

Network cabinets are commonly installed as floor-mounted, wall-mounted, or in-wall units, depending on space, equipment size, and accessibility requirements.

Floor-Mounted Cabinets

Floor-mounted cabinets are the most common type for offices, data centers, and large IT setups. They are typically 19-inch standard racks that can accommodate multiple units of servers, switches, and patch panels. These cabinets provide ample space for active and passive components, allow for better airflow, and can support heavier equipment. They often include metal or glass doors, ventilation trays, and cable management accessories to ensure organized and secure installations.

Wall-Mounted Cabinets

Wall-mounted cabinets are ideal for smaller offices, classrooms, or residential setups where floor space is limited. They are usually shallower and host fewer units, such as patch panels or small switches. Wall-mounted cabinets help keep equipment off the floor, reduce clutter, and maintain accessibility for maintenance. They are often used in environments where only a few network devices need centralized management.

In-Wall Cabinets
