

Computer Room Power Distribution Box System

Summary of Content

A Computer Room Power Distribution Box System delivers, manages, and monitors electrical power from facility feeds to IT equipment, ensuring reliability, scalability, and safety in data centers.

Overview

A computer room power distribution system is designed to distribute electrical power efficiently and safely from the main utility supply to servers, storage devices, and network equipment. It typically includes medium-voltage switchgear, transformers, low-voltage switchboards, uninterruptible power supplies (UPS), and rack-level Power Distribution Units (PDUs), forming a structured path from the facility feed to individual IT devices .

Key Components

1. Power Distribution Units (PDUs) PDUs are specialized devices that distribute power from a single input source to multiple output receptacles. They are engineered for high-density IT environments and can be basic, monitored, or intelligent:

- Basic PDUs provide reliable power without monitoring.
- Monitored PDUs offer real-time visibility into power consumption and environmental conditions.
