

Connecting lights from the distribution box

Summary of Content

Lights are connected from the distribution box to switches and fixtures via MCB-protected sub-circuits, with proper neutral and earth connections for safety.

Understanding the Distribution Box

A distribution box (DB) is the central point where electrical power is divided into sub-circuits for lights, sockets, and appliances. It typically contains:

- Main MCB: Controls the overall power supply to the DB.
- RCCB (Residual Current Circuit Breaker): Protects against leakage currents and electric shocks.
- MCBs (Miniature Circuit Breakers): Protect individual sub-circuits from overload or short circuits.
- Neutral and Earth Bars: Provide common connection points for neutral and earth wires from all circuits .

Wiring Lights from the DB

- Plan Sub-Circuits:
- Each lighting circuit should be connected to a dedicated MCB.
- For example, a 10A MCB can handle 8-10 light points in a domestic setup .
- Connect Phase and Neutral:
- The phase wire from the MCB goes to the switch.
