

Connecting the light from the distribution box

Summary of Content

Connecting a light distribution box involves safely wiring the main supply to the board, installing protective devices, and distributing power to subcircuits.

Key Steps for Connection

- Safety First: Ensure the main power supply is turned off before starting any work to prevent electrical shock .
- Mounting the Box: Secure the distribution box to a wall at an accessible height, ensuring the area is free of obstructions .
- Main Supply Connection:
 - Connect the incoming phase (live) wire to the main terminal or main MCB (usually brown or red).
 - Connect the neutral wire to the neutral bus bar .
- For single-phase systems, a double-pole MCB is often used as the main switch, while single-pole MCBs handle individual circuits .
- Installing Protective Devices:
 - Place RCCBs (Residual Current Circuit Breakers) to protect against leakage currents and electric shocks.
 - Install MCBs (Miniature Circuit Breakers) for each subcircuit to prevent overloads and short circuits .
