

# Cut section of thick optical cable

## Summary of Content

Cutting thick optical cables requires specialized tools, careful handling, and strict safety precautions to avoid fiber damage and personal injury.

### Safety Precautions

Fiber optic cables contain fine glass strands that can splinter and cause injury. Always wear safety goggles and gloves to protect your eyes and hands from microscopic shards. Work in a well-ventilated area and avoid touching exposed fiber ends with bare hands, as oils and dirt can degrade signal quality. Collect all fiber scraps in a designated disposal container to prevent hazards .

### Tools Required

For thick or armored optical cables, specialized cutting tools are essential:

- **Fiber Cable Cutters:** High-hardness alloy steel blades with adjustable spacing can handle multi-core or armored cables up to 3mm in diameter, ensuring clean cuts without crushing the fiber core .
- **Fiber Strippers:** Tools like FOS03 or RCS-0425 allow precise removal of the outer jacket and coatings without damaging the glass fibers .
- **Utility Tools:** For armored cables, additional tools such as wire cutters, pliers, and knives may be needed to cut steel or aramid reinforcements .

### Cutting Procedure

- **Identify the Section:** Use diagnostic tools like an OTDR to locate damaged or required sections. Mark the area clearly to avoid cutting too close to functional fibers
