

Denmark electrical distribution box dimensions

Summary of Content

Electrical distribution boxes in Denmark typically use modular systems with a standard module width of 192 mm, and sizes vary depending on the number of circuits and application.

Modular System and Standard Sizes

Many Danish distribution boxes, especially those for low-voltage applications, are built using a modular system. Each module is 192 mm wide, allowing flexibility in designing switchboards to match specific project requirements. The height and depth can be adjusted according to the number of modules stacked vertically and the type of components installed, such as circuit breakers or fuses. This modular approach is common for both residential and small commercial installations.

Residential Distribution Boards

For domestic use, distribution boards in Denmark often accommodate up to 7 circuits with a maximum current of 32 A per circuit. These boards are designed for indoor or outdoor use and include protective features like circuit breakers, grounding bars, and sometimes integrated sockets. While exact dimensions vary by manufacturer, typical residential enclosures are compact, often ranging from 300–600 mm in height, 200–400 mm in width, and 100–200 mm in depth, depending on the number of modules and additional features.
