

Dimensions of reserved holes for distribution boxes

Summary of Content

Reserved holes for distribution boxes should be approximately 20mm larger than the box dimensions in length and width, with a depth equal to the box thickness plus plastering.

Recommended Hole Dimensions

- Length and Width: The reserved hole should be about 20mm larger than the distribution box on all sides to allow for proper fitting and adjustments during installation .
- Depth: The depth of the hole should equal the thickness of the distribution box plus the thickness of the plastering on the inner wall of the hole .
- Alignment: The box should be installed horizontally and vertically, with a vertical deviation not exceeding 3mm .

Construction Considerations

- Prefabricated Slots: In modern construction, prefabricated members can be used to create distribution box grooves, reducing the need for chiseling and avoiding damage to lintels or structural elements .
- Fixing the Box: When embedding the box in masonry, it can be fixed by filling concrete between the box and the wall to ensure stability .
- Sealing and Protection: Edges around the box should be close to the wall, and contact surfaces should be coated with anti-corrosion paint to prevent damage .
