

Distribution Box Wiring Display

Summary of Content

A distribution box wiring display shows how electricity flows from the main supply through protective devices to individual circuits, with clear labeling of live, neutral, and earth connections.

Overview of a Distribution Box

A distribution box (DB), also called a distribution board, panel board, or consumer unit, is the central hub for electrical power in a building. It receives electricity from the main supply and distributes it safely to various circuits, such as lighting, appliances, and outlets, while protecting against overloads and short circuits using circuit breakers, fuses, and RCDs . Inside the box, you will typically find busbars, terminal blocks, DIN rails, and wiring connections .

Wiring Layout and Display

The wiring display of a distribution box is usually represented in a diagram showing:

- **Main Supply Connection:** The live (phase) and neutral wires from the utility meter enter the main switch or double-pole MCB (DP) in single-phase systems, or the three live wires and neutral in three-phase systems .
- **Protective Devices:** Circuit breakers (single-pole or double-pole) and RCDs are connected to the busbars. Each breaker corresponds to a specific circuit in the building .
- **Outgoing Circuits:** Wires from the breakers connect to sub-circuits, supplying power to lights, fans, air conditioners, and other appliances. Neutral wires are connected to the neutral busbar, and earth wires to the grounding busbar .
