

Distribution Box and Switch Installation

Summary of Content

Proper installation of distribution boxes and switch boxes ensures safe, reliable, and efficient power distribution while preventing electrical hazards.

Selection and Preparation

Choose qualified distribution and switch boxes that meet national safety standards and are suitable for the intended environment (indoor/outdoor, residential, commercial, or industrial) with appropriate IP/NEMA ratings for protection against dust, water, and corrosion. Ensure the box material is durable, such as iron plate ($>1.5\text{mm}$) or high-quality insulating material, and that it can accommodate current loads with room for future expansion.

Placement and Accessibility

Install the main distribution box close to the power supply and the distribution box near concentrated electrical loads. The switch box should be within 30 meters of the distribution box, and the horizontal distance to controlled equipment should not exceed 3 meters. Ensure the location is dry, ventilated, and free from harmful gases, liquids, heat sources, or vibration. Leave sufficient space around the boxes for maintenance and operation by two people.

Wiring and Grounding

Use insulated wires and ensure all connections are firm, with no exposed live parts. Separate the working neutral line from the maintenance neutral line using terminal boards. All metal parts, including the box and device plates, should be properly grounded. Follow the circuit diagram and wiring specifications carefully, and include protective devices such as MCBs, RCCBs, fuses, and surge protectors for each circuit.
