

Distribution box corresponding to the module

Summary of Content

Distribution boxes are modular enclosures designed to house and organize specific modules, such as circuit breakers, RCDs, or optical fibre components, ensuring safe and efficient distribution of power or signals.

Electrical Distribution Boxes

Electrical distribution boxes, also known as DB boxes, serve as central hubs for distributing electrical power from a main supply to multiple circuits within a building. They are designed to accommodate modular components such as fuses, circuit breakers, and RCDs. Each module typically corresponds to a unit of space on a DIN rail, often measured in TE (module width units), where 1 TE usually corresponds to one switch or fuse. Surface-mounted or wall-mounted DB boxes can be configured to hold multiple modules, with options for transparent or opaque doors, polycarbonate or ABS materials, and safety locks for secure access. Smart DB boxes may also include energy monitoring units or communication modules for real-time data collection and remote control.
