

Fiber Optic Box Terminal Box Disassembly

Summary of Content

Disassembling a fiber optic terminal box requires careful handling to protect the fibers, remove the cover, and access internal splice trays and cable guides.

Preparation

- **Safety First:** Wear protective gloves and safety glasses to prevent injury from fiber shards or sharp edges. Ensure the work area is well-lit and free of dust or debris .
- **Power and Network Check:** Confirm that the fiber network is inactive or that the segment being worked on is isolated to prevent signal disruption .
- **Gather Tools:** Common tools include a Phillips screwdriver, flathead screwdriver, cable ties, and a fiber optic cleaning kit .

Disassembly Steps

- **Open the Box Cover:** Most fiber termination boxes have screws or latches securing the cover. Carefully unscrew or unlatch the cover to avoid sudden movement that could stress the fibers .
- **Inspect Internal Layout:** Identify the splice trays, fiber guides, and pigtails. Note the routing of fibers and any labeling to ensure proper reassembly .
- **Remove Splice Trays:** Gently lift the splice trays from their mounts. If trays are clipped in, release the clips carefully to avoid bending or breaking fibers .
