

Fiber Optic Cable Survey Instrument 202

Summary of Content

The Fiber Optic Cable Survey Instrument 202, such as the Kangwei CT-202, is a non-destructive tester used to locate and inspect fiber optic cables efficiently.

Overview

The Kangwei CT-202 Optical Cable Survey Instrument is designed to detect and trace fiber optic cables without damaging them. It operates by knocking or tapping along the cable to identify its path, locate faults, and verify continuity in fiber optic networks, making it ideal for routine inspections and maintenance of installed fiber infrastructure. This type of instrument is particularly useful in urban or complex network environments where cables are buried or routed through conduits.

Key Features

- Non-destructive testing: Allows technicians to survey fiber optic cables without cutting or splicing them.
- Fault detection: Helps identify breaks, bends, or damaged sections along the fiber route.
- Ease of use: Portable and ergonomic, suitable for fieldwork.
- Compatibility: Can be used with various fiber types, including multimode and single-mode cables.
