

Fiber optic cables for home use

Summary of Content

Fiber optic cables deliver high-speed, reliable internet to homes by transmitting data as light, offering superior bandwidth, low latency, and immunity to electrical interference.

What Fiber Optic in the Home Means

Fiber optic internet, often called Fiber to the Home (FTTH), uses ultra-thin strands of glass or plastic to transmit data as light pulses directly to residences, replacing traditional copper or coaxial lines . This allows for gigabit-level speeds, symmetrical upload and download rates, and minimal signal loss, making it ideal for streaming, gaming, remote work, and smart home devices . Fiber can also support triple-play services, delivering internet, TV, and phone over a single connection .

Installation Overview

- **Service Entry:** A fiber cable is run from a nearby terminal (pole or underground box) to your home, where it connects to a Network Interface Device (NID) .
- **Optical Network Terminal (ONT):** Inside or just outside the home, the ONT converts light signals into electrical signals for your router or gateway . It requires a dedicated power source and is typically placed near other networking hardware .
- **Router or Gateway:** The router distributes the internet to devices via Wi-Fi or Ethernet. For optimal performance, modern routers supporting gigabit speeds and Wi-Fi 6 are recommended .
