

Fiber optic connection to a router

Summary of Content

To connect a fiber optic internet connection to your router, you need an Optical Network Terminal (ONT) to convert the fiber signal into Ethernet, which then connects to your router's WAN port.

Required Equipment

- Optical Network Terminal (ONT): Provided by your ISP, this device converts the incoming fiber optic signal into an electrical signal compatible with standard networking equipment .
- Fiber optic cable: Typically a thin, yellow cable with SC/APC or SC/UPC connectors .
- Ethernet cable: Cat6 or higher is recommended to maintain high-speed data transfer between the ONT and router .
- Router: Ensure it supports fiber-ready input or at least gigabit speeds to fully utilize fiber performance .
- Power supply: For both the ONT and router, ideally with surge protection .

Step-by-Step Connection Process

- Locate the fiber wall outlet: This is where your ISP's fiber line enters your home .
- Connect the fiber optic cable to the ONT: Remove protective caps from both the cable and ONT port, align the connector, and insert until it clicks securely . Handle the fiber connector carefully to avoid dirt or damage .
- Power on the ONT: Wait 2-5 minutes for the status lights to stabilize, indicating a successful connection to your ISP .
