

Fiber optic connector key angle

Overview

It must be ensured that the orientation of the fiber interface is correct, e. Then the fiber end needs to be carefully inserted. Fiber connectors are essential components used to terminate optical fiber cables, creating non-permanent or removable fiber joints for connecting fiber-coupled devices. This article explains the delicate process of fitting a connector to a fiber, which involves cleaving, precise positioning, and. Typically, APC connectors have a key notch for a proper angles alignment. Ferrule flange is a precision metal holder for a zirconia ceramic cylinder that aligns mating fiber cores for optimum transmission. Angled Physical Contact (APC) is a specialized optical fiber connector polishing style where the ferrule end-face is ground to a precise 8-degree angle. They come in various types like SC, LC, ST, and MTP, each designed for specific. With APC ferrules, we have an angled surface that MUST be oriented in a specific location relative to the connector key (if not, then two angled connectors would never mate together when connected). The causes of Key. For applications requiring very low back-reflection, the fiber end-face is polished at an angle (the typical industry standard being 8°) to prevent light that reflects from the interface from traveling back up the fiber.
