

Fiber optic router has a red light

Summary of Content

A red light on a fiber optic router usually indicates a loss of signal or a problem preventing the router from connecting to your Internet Service Provider (ISP).

What the Red Light Means

On most fiber optic routers, a red light—often labeled as LOS (Loss of Signal) or WAN/Broadband—signals that the router is not receiving a proper connection from the ISP. This can appear as a solid red light or a blinking red light, both indicating a critical issue with connectivity rather than normal operation. Unlike green or blue lights, which indicate normal operation or active data transfer, red lights point to a problem that needs attention.

Common Causes

- **Fiber Optic Cable Damage:** Physical cuts, bends, or kinks in the fiber cable can disrupt the signal.
- **Service Outage:** ISP maintenance or local outages can temporarily prevent your router from connecting.
- **Loose or Faulty Connections:** Improperly connected cables or damaged connectors can trigger a red light.
- **Router or ONT Malfunction:** Hardware issues with the router or Optical Network Terminal (ONT) may prevent signal reception.
- **Power Issues:** Fluctuations or insufficient power supply can cause the router to fail to establish a connection.
