

Fiber optic router internet speed slowed down

Summary of Content

Fiber optic internet speed can slow down due to router limitations, Wi-Fi interference, network congestion, or device issues, and most problems can be resolved with simple troubleshooting.

Common Causes of Slowed Fiber Speeds

1. Router Limitations Older routers may not support the high speeds provided by fiber connections, especially gigabit or multi-gigabit plans. Routers with outdated Wi-Fi standards (e.g., Wi-Fi 4 or Wi-Fi 5) or insufficient processing power can become bottlenecks, limiting the speed reaching your devices. Overheating, firmware bugs, or hardware degradation can also reduce performance . 2. Wi-Fi Signal Interference Physical obstructions like walls, metal furniture, or appliances can weaken Wi-Fi signals. Nearby networks, Bluetooth devices, and even microwave ovens can interfere with your Wi-Fi, causing slower speeds . 3. Network Congestion High usage periods, multiple devices streaming or gaming simultaneously, or shared fiber infrastructure in some areas can reduce available bandwidth, leading to slower speeds . 4. Device Limitations Older computers, smartphones, or network interface cards may not handle high-speed fiber connections efficiently. Software issues, outdated drivers, or browser inefficiencies can also impact perceived speed .

Steps to Improve Fiber Internet Speed

- Run a Speed Test Use a reliable speed test while connected via Ethernet to check if your speeds match your plan. Disconnect other devices and close background applications for accurate results .
