

Fiber-to-electrical converter

Summary of Content

A fiber-to-electrical converter is a device that converts optical signals transmitted over fiber optic cables into electrical signals for use in electronic equipment.

Overview

Fiber-to-electrical converters, also known as optical-to-electrical converters or media converters, are used to transform light signals carried by fiber optic cables into electrical signals compatible with copper-based devices or digital systems . These devices are essential in applications where long-distance, high-speed, or electrically noisy environments make direct copper connections impractical.

Types and Applications

- **Ethernet Fiber Converters:** These convert copper Ethernet signals to optical signals for transmission over fiber and then back to electrical signals at the receiving end. They are widely used in campus networks, industrial automation, and remote device connections .
- **Broadcast and SDI Converters:** Devices like the Ross Video FSR-6601 convert fiber optic signals carrying serial digital interface (SDI) video data into electrical SDI outputs, supporting data rates from 143 Mb/s up to 2.97 Gb/s .
- **High-Speed Test Converters:** Keysight's N7004A converts optical telecom or data communication signals directly into electrical signals for real-time oscilloscope analysis, supporting bandwidths up to 33 GHz and data rates up to 28 Gbps .
- **Logic and Timing Converters:** Highland Technology's J730 provides digital logic outputs and fast analog monitoring for transporting critical timing signals over fiber in high electromagnetic interference (EMI) environments .
