

How long does it typically take for a telecommunications fiber optic cable installation project to complete

Summary of Content

Installing a fiber optic cable can take anywhere from a few hours for a simple residential setup to several weeks for complex commercial projects.

Residential Installation

For most homes, fiber optic installation is relatively quick. If the building already has existing conduits or infrastructure, the process typically takes 2 to 6 hours to complete, including setting up the optical network terminal (ONT) and testing the connection . The installation involves a site survey, running the fiber from the street or node to the home, connecting the ONT, and configuring network equipment . Simple aerial installations are usually faster than underground installations, which may require trenching or duct work .

Commercial Installation

Commercial or large-scale installations are more complex and can take several days to several weeks, depending on the building size, existing infrastructure, and coordination requirements . Factors such as permits, access to risers, server rooms, and coordination with building management can extend the timeline . New fiber runs in buildings without pre-existing infrastructure require careful planning, surveying, and installation, which adds to the duration .

Factors Affecting Installation Time
