

How to change router settings for fiber optic access

Summary of Content

To set up your router for fiber optic internet, connect it to the Optical Network Terminal (ONT), configure the WAN settings with your ISP credentials, and optimize Wi-Fi and security settings for best performance.

Step 1: Understand Your Fiber Setup

Fiber internet requires an Optical Network Terminal (ONT), which converts the light signals from the fiber line into electrical signals your router can use. The fiber cable does not connect directly to a standard router. Ensure your router is fiber-compatible and has a WAN port or SFP port for connection.

Step 2: Physical Connections

- Connect the fiber cable from the wall outlet to the ONT's optical input port. Handle the fiber connector carefully to avoid dirt or damage.
- Power on the ONT and wait for the status lights to stabilize (usually 2-5 minutes).
- Connect the ONT to your router using an Ethernet cable from the ONT's LAN port to the router's WAN port.
- Place the router in a central, open location for optimal Wi-Fi coverage.

Step 3: Router Configuration

- Access the router's admin interface via a web browser (commonly 192.168.1.1 or a router-specific URL).
