

How to change the settings of a mobile fiber optic router

Summary of Content

To adjust a mobile fiber optic router, connect it to the ONT, access the admin panel via a browser or app, and configure network settings, Wi-Fi, and security for optimal performance.

Step 1: Connect Your Router

Start by connecting your router to the Optical Network Terminal (ONT) using an Ethernet cable. The ONT converts the fiber optic signal into Ethernet, which your router uses to distribute internet access. Ensure the router's WAN port is connected to the ONT, and plug in the power supply.

Step 2: Access the Router Settings

Open a web browser on a connected device and enter the router's IP address (commonly 192.168.1.1) to access the admin panel. Some routers also allow configuration via a mobile app, which can simplify adjustments and monitoring. Log in using the default credentials provided by your ISP or router manufacturer.

Step 3: Configure Network Settings

- **ISP Credentials:** Enter your ISP-provided username and password if required.
- **VLAN, DHCP, or PPPoE Settings:** Adjust these if your ISP specifies particular configurations.
- **Wi-Fi Name and Password:** Set a strong password and customize your network name (SSID) for easy identification.
