

How to configure the network port of an all-optical switch

Summary of Content

To configure an all-optical switch port, you need to access the interface configuration mode, set port speed and duplex, assign VLANs, and ensure optical transceiver compatibility.

Accessing the Port

Begin by connecting to the switch via CLI using SSH, Telnet, or a console cable. Enter privileged EXEC mode and then global configuration mode. From there, access the specific port using the interface command (e.g., interface GigabitEthernet1/0/1) to enter interface configuration mode .

Enabling or Disabling Ports

Ports may be enabled by default, but for security or operational reasons, you can disable a port using the shutdown command and re-enable it with no shutdown . This ensures proper traffic control and prevents unauthorized access.

Configuring Port Speed and Duplex

Set the port speed and duplex to match the connected device. Auto-negotiation is recommended to avoid mismatches, but if manual configuration is required, ensure both ends have identical settings. For optical ports, verify the supported speeds (1G, 10G, etc.) and duplex mode .
