

How to connect a 4-core fiber optic cable with a power cord

Summary of Content

To connect a 4-core fiber optic cable with a power cord, you must handle the fiber and power separately, ensuring proper splicing or connectors for the fiber while safely routing the power cord alongside it.

Fiber Optic Cable Preparation

- **Strip and Clean the Fiber:** Use a fiber optic stripper to remove the outer jacket and buffer coating, exposing the glass fibers without breaking them. Clean the exposed fibers with alcohol wipes to remove dust, oil, or residue ().
- **Cleaving the Fiber:** Use a fiber cleaver to make a precise, flat cut at the fiber end. This ensures minimal signal loss when connecting or splicing ().
- **Splicing or Connector Installation:**
 - **Fusion Splicing:** Align the fibers in a fusion splicer to permanently join them, which is ideal for long-term, low-loss connections ().
 - **Connector Use:** For quick connections, insert the cleaved fiber into SC, LC, or ST connectors, securing them with a crimp or housing as needed ().

Power Cord Integration

- **Separate Routing:** Keep the power cord physically separate from the fiber strands to prevent electromagnetic interference and accidental damage to the delicate fibers ().
