

How to connect an overhead line junction box

Summary of Content

Connecting an overhead line junction box requires selecting the right box, securing cables, making proper splices, grounding correctly, and following safety protocols.

Step 1: Safety First

Before starting, turn off the power at the main service panel and verify with a non-contact voltage tester that all wires are de-energized to prevent electrical shock . Wear insulated gloves and eye protection to reduce the risk of injury .

Step 2: Select the Right Junction Box

Choose a junction box suitable for outdoor or overhead use, typically weatherproof and rated for damp or exposed conditions . Ensure the box is large enough to accommodate all conductors, splices, and connectors without overcrowding, which can cause heat buildup .

Step 3: Mount the Box

Securely mount the junction box to a stable structure, such as a pole or crossarm, using screws or brackets appropriate for the material . Ensure the box is accessible for future inspection or maintenance.

Step 4: Prepare the Wires

- Strip 3/4 inch (19 mm) of insulation from each conductor entering the box .
- Maintain color coding: black/red for hot, white/gray for neutral, and green/bare for ground .
