

How to connect fiber optic cables and fiber optic drop cables

Summary of Content

A fiber optic drop cable connects the distribution network to the subscriber's premises, typically using preterminated connectors or splicing to ensure reliable, high-speed connectivity.

Overview of Fiber Optic Drop Cables

Fiber optic drop cables are the final segment of the optical distribution network (ODN), linking the distribution cable terminal (such as a Fiber Access Terminal or FAT box) to the subscriber's Optical Network Terminal (ONT) or Optical Network Unit (ONU) inside the home or business . These cables usually contain 1 to 4 fibers, are lightweight, flexible, and designed to handle tight bends without significant signal loss . They can be installed aerially, underground, or indoors, depending on the environment .

Connection Methods

1. Preterminated (Plug-and-Play) Drop Cables

Preterminated drop cables are factory-terminated on one or both ends, allowing for simple plug-and-play installation at the subscriber interface . The main distribution cable is typically terminated in a fiber distribution hub (FDH) or terminal box, where the drop cable can be connected using mechanical connectors or adapter panels. This method eliminates the need for field splicing and reduces installation time and labor costs .

2. Fusion Splicing
