

How to connect the switch distribution box

Summary of Content

To connect a distribution box to a switch box, run phase, neutral, and earth wires from the DB's output MCBs to the corresponding terminals in the switch box, ensuring proper protection and labeling.

Step-by-Step Connection

1. Identify the Main and Branch Circuits

- The distribution box (DB) contains the main MCB or main switch, branch MCBs, and protective devices like RCCBs for safety .
- Each switch box in a room receives power from a specific branch MCB in the DB . 2. Prepare the Wiring

- Use appropriate wire sizes based on the load (e.g., 1.5 mm² for lighting, 2.5 mm² for sockets).

- Label wires for phase (live), neutral, and earth to avoid confusion .

- Ensure wires are bound neatly with plastic ties and routed without sharp bends . 3. Connect the DB to the Switch Box

- From the output terminals of the branch MCB in the DB, run the phase wire to the live terminal of the switch box.

- Connect the neutral wire from the DB's neutral bus to the neutral terminal in the switch box.
