

How to connect to the internet using a router when there is no fiber optic connection

Summary of Content

You can access the internet without a fiber optic router using mobile hotspots, fixed wireless, satellite internet, or Wi-Fi sharing from other devices.

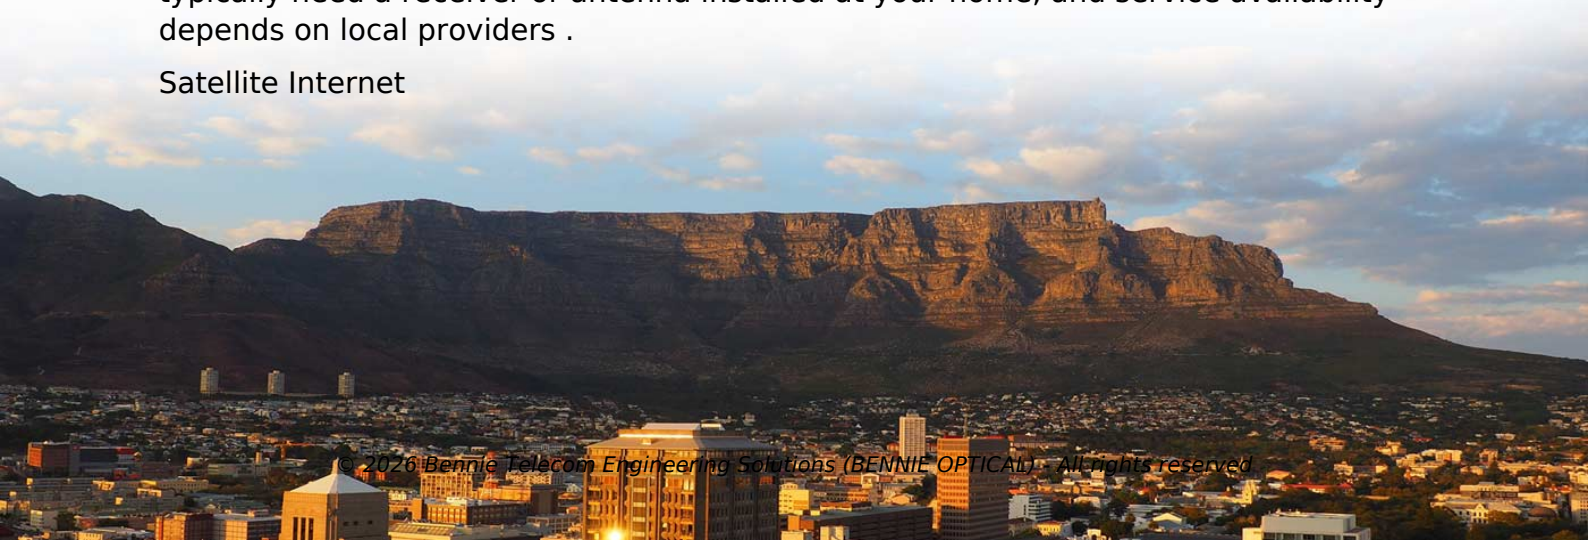

Mobile Hotspots

A mobile hotspot allows you to use your smartphone or a dedicated device to create a Wi-Fi network. Your phone connects to the cellular network (4G or 5G) and shares the connection with other devices. This method is quick to set up and portable, supporting multiple devices simultaneously. Ensure your data plan supports hotspot usage, and consider unlimited plans to avoid overage charges .

Fixed Wireless Internet

Fixed wireless connects your home to a nearby communication tower using radio signals, bypassing the need for cables. It provides high-speed internet similar to traditional broadband and is suitable for urban, suburban, and some rural areas. You typically need a receiver or antenna installed at your home, and service availability depends on local providers .

Satellite Internet
