

How to install the system on a terminal box

Summary of Content

You can install a system on a terminal box using a bootable USB, command-line installation, or containerized environments like Distrobox or WSL.

Preparation

- **Check Hardware Requirements:** Ensure your terminal box has sufficient RAM (at least 1-2 GB recommended) and free disk space (5-20 GB depending on the OS) for installation .
- **Download Installation Media:** Obtain the ISO image of the operating system you want to install (e.g., Ubuntu, Debian) from the official website .
- **Create Bootable Media:** Use a USB drive or DVD and tools like Rufus (Windows) or dd (Linux) to make it bootable .

Terminal-Based Installation

- **Boot from USB/DVD:** Insert the bootable media and restart the terminal box. Enter BIOS/UEFI settings (usually via F1, F2, or Delete) and set the boot order to prioritize the USB or DVD .
- **Start Text-Based Installer:** Many Linux distributions offer a text-based or minimal installer. This allows you to configure partitions, select packages, and set up the system entirely via the command line .
- **Partition and Format Disks:** Use commands like fdisk or parted to create partitions. Format them with mkfs (e.g., mkfs.ext4 /dev/sda1) for Linux installations .
