

How to match the switch with the wiring in the distribution box

Summary of Content

To match a switch with the wiring in a distribution box, identify the input and output terminals, connect the phase and neutral wires correctly, and ensure proper grounding and safety checks.

Step 1: Safety First

Before starting, turn off the main power supply at the main circuit breaker to prevent electric shock. Use a voltage tester to confirm that the circuit is de-energized before touching any wires .

Step 2: Identify Components

- **Main MCB (Double Pole):** Receives the incoming phase and neutral from the power supply. It controls the overall power to the distribution box .
- **RCCB (Residual Current Circuit Breaker):** Provides protection against leakage currents and electrical shocks. Connect the output of the main MCB to the input of the RCCB .
- **Branch MCBs (Single or Double Pole):** Control individual loads. Single-pole MCBs are used for standard loads, while double-pole MCBs are used for special loads requiring both phase and neutral switching .

Step 3: Wiring the Switch

- Connect the phase wire from the output of the RCCB to the input terminal of the switch or MCB controlling the load .
