

How to neatly arrange the wires when building a distribution box

Summary of Content

Proper wiring in a distribution box ensures safety, compliance, and efficient power distribution.

Preparation and Safety

Before starting, ensure the power supply is completely turned off and verified with a tester. Wear insulating gloves, safety glasses, and non-slip shoes to prevent electric shock. Inspect the distribution box and accessories for damage, and prepare circuit breakers, wires, ties, and insulating materials that meet the design specifications and local electrical standards .

Wire Arrangement and Color Coding

- **Circuit Breaker Placement:** Arrange breakers from left to right, reserving space on the right for future expansion .
- **Wire Colors:** Use blue for neutral, yellow for phase A, green for phase B, and red for phase C to comply with standard wiring codes .
- **Wire Gauge:** Select wire size according to load: typically 2.5mm² for lighting and sockets, and 2.5–4.0mm² for air conditioning or high-load circuits .

Connection Method

- Connect each wire from the incoming power source to the input terminal of the corresponding breaker.
- For multiple connections, parallel wiring can reduce complexity.
