

How to reconfigure a fiber optic router

Summary of Content

To modify a fiber optic router, connect it to the ONT, access the admin panel, update firmware, and configure network settings for optimal performance.

Step 1: Understand Your Setup

Fiber internet requires an Optical Network Terminal (ONT), which converts light signals from the fiber line into Ethernet signals your router can use . Ensure your router is fiber-ready and supports gigabit or multi-gigabit speeds. Identify the fiber wall outlet and the ONT location in your home for proper connection .

Step 2: Connect the Hardware

- **Fiber Cable to ONT:** Plug the fiber optic cable into the ONT's designated port, ensuring proper seating to avoid signal loss .
- **ONT to Router:** Use a high-quality Ethernet cable (Cat6a or higher) to connect the ONT's Ethernet/LAN port to the router's WAN port .
- **Power On Devices:** Turn on the ONT first, wait for status lights to stabilize, then power on the router .

Step 3: Access Router Settings

Open a web browser and enter the router's IP address (commonly 192.168.1.1 or 192.168.0.1) to access the admin panel . Log in using the default credentials or those provided by your ISP.

Step 4: Configure Network Settings

- **ISP Credentials:** Enter your username and password if required by your provider .
