

How to strip the outer sheath of a 4-core optical cable

Summary of Content

Use a proper fiber optic sheath stripper to carefully remove the outer jacket without damaging the internal fibers.

Tools Required

- Fiber optic jacket stripper: Designed for 2–4 microcables, adjustable for different diameters (4.5–40mm) and ensures clean cuts without harming fibers .
- Kevlar scissors: For cutting strength members like aramid yarn.
- Lint-free cloth and isopropyl alcohol: For cleaning fibers after stripping .
- Optional needle-nose pliers: To assist in removing the sheath after cutting .

Step-by-Step Procedure

- Measure and mark the length of the outer sheath to be removed according to your installation or connectorization requirements .
- Set the stripper blade depth to match the cable diameter, ensuring it cuts only the outer jacket and not the inner fibers .
- Place the cable in the stripper slot and hold it perpendicular to the tool. For circular or tight-jacket cables, a helical or spiral cut may be used for midspan stripping .
- Rotate the tool around the cable to score the sheath completely. For longitudinal strippers, pull the tool along the cable length to cut the jacket .
