

How to unplug a fiber optic router

Summary of Content

To safely unplug a fiber optic router interface, power down the device, identify the connector type, and gently remove the cable along its axis while protecting the connectors from dust and damage.

Step-by-Step Instructions

1. Power Down the Router or ONT Disconnect the router or optical network terminal (ONT) from its electrical source. This ensures the fiber port is inactive and reduces the risk of exposure to infrared light signals, which can be harmful to the eyes . 2. Identify the Connector Type Most residential fiber connections use SC (Subscriber Connector) or LC (Lucent Connector) types. SC connectors are square and use a push-pull mechanism, often with a plastic locking tab. LC connectors are smaller and use a clip or latch that must be squeezed to release . 3. Prepare the Work Area Keep the area clean and free of dust or debris. Even microscopic particles can damage the glass tip of the fiber connector . Use an antistatic mat or wrist strap if handling transceivers in enterprise routers . 4. Remove the Cable

- Grip the connector body, not the cable itself, to avoid stressing the internal fibers .
- Pull gently and straight along the axis of the connector. Avoid twisting, wiggling, or applying lateral force .
