

How to use the Huawei beam splitter kit

Summary of Content

The Huawei beam splitter kit is used to split and multiplex optical signals in a passive fiber network, enabling efficient distribution of light to multiple endpoints without requiring power.

Overview

The Huawei beam splitter kit, also known as a passive aggregation module, is designed for all-optical networks. It splits incoming optical signals from a central module into multiple outputs for distribution to remote devices, or conversely, it can multiplex signals from multiple remote devices into a single uplink channel. The kit operates passively, meaning it does not require a power supply, which reduces fire risks and simplifies installation.

Installation Steps

- Select the Installation Location
 - Indoor options include central computer rooms, building weak current wells, or floor wiring boxes.
 - Outdoor installations may require specialized enclosures to protect the splitter from environmental factors.
- Mount the Module
 - The splitter can be installed in a subrack or directly mounted in a rack. Each subrack typically has multiple slots, and one module (e.g., HW-PEN-16LC-2KM or HW-PEN-16LC-10KM) can be installed per slot.
- Ensure the module is securely fixed to prevent movement or fiber stress.
