

How to wire bridge cables in a distribution box

Summary of Content

Bridge cables in a distribution box are used to connect multiple terminals or circuit breakers together, ensuring a common electrical path while maintaining safety and proper insulation.

Understanding Bridge Cables

Bridge cables, also called jumper wires, are short lengths of wire used to connect multiple terminals or circuit breakers in a distribution box. They are commonly used to distribute a single phase or neutral line to multiple circuits without running separate wires from the main supply to each breaker.

Safety First

- Turn off the main power before starting any work to prevent electrical shock .
- Use insulated tools and wear protective gloves.
- Ensure the distribution box is properly grounded and mounted securely .

Step-by-Step Wiring Process

- Plan the layout: Identify which terminals or breakers need to be bridged. Typically, bridge cables connect the live (phase) terminals or neutral terminals across multiple breakers .
- Select the correct wire gauge: The bridge cable must handle the total current of all connected circuits. Refer to the breaker ratings and local electrical codes.
