

How to wire the indicator lights in the distribution box

Summary of Content

Indicator lights in distribution boxes are typically wired in parallel with a common neutral, using color-coded wires to indicate operational status, and protected by appropriate circuit breakers.

Wiring Configuration

Single-phase distribution boxes: Indicator lights are usually connected in parallel with the load, allowing each light to independently show the status of its respective circuit. A common neutral wire is shared among all lights, while each light has its own hot wire connected to the phase it monitors. Three-phase distribution boxes: Each phase (R, Y, B) has its own hot wire connected to the corresponding indicator light, while the neutral remains common. This setup allows clear phase indication and ensures that each light accurately reflects the presence of voltage on its phase. Protection: A single 3-pole circuit breaker can be used to protect multiple indicator lights across three phases, typically rated at 2A for low-power pilot lamps.

Color Coding

IEC and industry guidance recommend semantic coloring to convey operational meaning:

- Red: Danger or ON status (e.g., breaker closed, circuit energized)
- Green: Safe or OFF status (e.g., breaker open, circuit de-energized)
- Yellow/Amber: Trip or warning condition
