

Huawei fiber optic router for whole-house coverage

Summary of Content

Huawei's FTTR (Fiber to the Room) solution delivers stable gigabit Wi-Fi and full-home fiber connectivity using a main GPON router and distributed access points.

Overview of Huawei FTTR

Huawei's FTTR system extends fiber optic connections directly to individual rooms, solving the “last-meter” coverage problem in home networks . The system replaces traditional in-house Ethernet cabling and can also extend basement or building-level fiber connections (FTTB). The core device, such as the OptiXstar V166a20, functions as a GPON main router with 2.5 Gbit/s and 1 Gbit/s Ethernet ports, connecting to a distribution box that supports multiple sub-FTTR devices . These sub-devices act as Wi-Fi access points and Gigabit Ethernet ports, forming a mesh network where devices automatically connect to the strongest signal.

Key Features

- **High-Speed Connectivity:** Supports gigabit Wi-Fi 6, ensuring fast and stable internet for streaming, gaming, and remote work .
- **Mesh Wi-Fi Network:** Multiple access points can be deployed throughout the home, with up to 16 access points supported for large houses, maintaining full bandwidth without signal loss .
- **End-to-End Intelligent Management:** Huawei's NCE and LinkHome app allow real-time monitoring of network status, parental controls, and device management .
