

Installation of electrical distribution boxes at construction sites in Mauritius

Summary of Content

Electrical distribution boxes at construction sites in Mauritius must be installed by competent personnel, following safety guidelines, proper earthing, labeling, and circuit segregation to ensure safe and reliable power distribution.

Regulatory and Safety Requirements

All electrical installations, whether temporary or permanent, must be designed, erected, maintained, and periodically tested by qualified personnel. The installation should include proper earthing arrangements, protective devices, and updated circuit drawings. Adequate access, working space, and lighting must be provided around distribution boxes to prevent hazards during operation or maintenance. Low voltage circuits must be separated from extra-low voltage circuits, and electrical services should not share conduits with non-electrical services .

Installation Practices

- **Placement and Protection:** Distribution boxes should be installed in locations protected from rain, water accumulation, and mechanical damage. Metallic enclosures and conduits exposed to damp conditions must be corrosion-resistant .
- **Circuit Segregation:** Each installation should be divided into circuits to facilitate safe operation, inspection, and maintenance, reducing the risk of faults affecting the entire site .
