

# Iron-reinforced lightweight cable trays

## Overview

Wire mesh cable trays—often called basket trays —are constructed from welded steel wire, forming a lightweight open-grid structure. Unlike traditional formed trays, wire mesh trays rely on distributed wire intersections for strength rather than solid rails or rungs. They are lightweight, corrosion-resistant, and non-conductive, making them ideal for industries exposed to moisture, chemicals, and outdoor environments. Core Features: (Learn more about FRP Cable Trays) What Are GI Cable. The Corrugated Base Energy-Saving Cable Tray enhances strength using structural reinforcement principles, allowing reduced plate thickness without compromising load capacity. The bottom part of the perforated cable tray has openings, which provide ventilation and prevent overheating. It is ideal for installations where it is essential to mitigate the effects of magnetic fields. Cable tray systems are engineered support structures designed to route, support, and protect insulated electrical cables used for power distribution, control, instrumentation, and communication.
