

Joining a junction box with 2 cores

Summary of Content

To join 2-core cables in a junction box, strip the insulation, match each core to the corresponding terminal, secure with screws or connectors, and ensure proper grounding and enclosure closure.

Step-by-Step Guide

1. Safety First Before starting, turn off power at the main service panel and verify with a non-contact voltage tester that the wires are de-energized (). This prevents electric shock and ensures safe handling. 2. Prepare the Junction Box Select a junction box with terminals that can accommodate two cores per terminal (). Ensure the box is accessible, properly mounted, and suitable for the environment (e.g., indoor, outdoor, or hazardous area) (). 3. Strip the Cable

- Remove the outer sheath of each cable only as far as necessary to reach the terminals.
- Strip approximately 12 mm (1/2 inch) of insulation from each core, exposing the copper conductor ().
- Avoid exposing excess conductor to prevent short circuits. 4. Connect the Wires
- Match each core by function: live to live, neutral to neutral, and earth to earth ().
- Insert the stripped ends into the terminal block and tighten the screws securely. Loose connections can cause heat buildup and fire hazards ().
- For earth wires, use green/yellow sleeving and ensure all earth cores are connected together (). 5. Organize and Secure
