

Lightning Protection Design for Distribution Boxes

Overview

For lightning protection of distribution box transmission line, reasonable lightning protection methods shall be adopted through technical and economic comparison according to the voltage level, load nature and system operation mode of distribution box line, combined. For lightning protection of distribution box transmission line, reasonable lightning protection methods shall be adopted through technical and economic comparison according to the voltage level, load nature and system operation mode of distribution box line, combined. The DEHN Risk Tool makes risk management easier and ensures standard-compliant assessment in just a few steps. It includes a risk analysis according to the new IEC 62305-2* standard with national adaptations. The separation distance defines the minimum distance of the lightning protection system. In areas with frequent lightning strikes, electrical equipment is easily damaged by lightning strikes. To reduce the damage caused by lightning strikes, the surge protector in the distribution box plays an important role.
