

Mercury Router Fiber Optic Setup

Summary of Content

Installing Mercury fiber internet involves connecting the Optical Network Terminal (ONT) to your router, ensuring compatibility, and configuring your network for optimal performance.

Step 1: Check Compatibility

Mercury allows you to use your own router with fiber internet, but it must have a Gigabit Ethernet WAN port, support VLAN tagging, and be capable of DHCP/IP over Ethernet (IPoE). Using your own router gives flexibility but may require you to handle troubleshooting, while Mercury provides all foundational equipment needed to get connected .

Step 2: ONT Installation

The Optical Network Terminal (ONT) is provided by Mercury and converts fiber optic signals into Ethernet data. A qualified technician will install the ONT, which may involve:

- External work: Running fiber from the property boundary to the house via aerial, shallow buried, or underground conduit .
- Internal work: Positioning the ONT inside your home and connecting it to your router . Professional installation typically takes 2-6 hours for residential setups .

Step 3: Router Connection

Once the ONT is installed:

- Plug your router into a power outlet.
