

Mesh-type cable tray cabling system

Summary of Content

Wire mesh cable trays, also known as basket trays, are lightweight, open-grid systems ideal for low-voltage, telecommunication, and fiber optic cables, offering flexibility, ventilation, and easy installation.

Overview of Wire Mesh Cable Trays

Wire mesh cable trays are constructed from welded steel wires forming an open-grid structure, which allows for excellent airflow and heat dissipation around cables, making them particularly suitable for data centers, IT networks, and telecommunications facilities . Their open design also enables easy visual inspection, routing, and management of cables, and simplifies modifications or upgrades without major disassembly .

Key Types and Variations

While wire mesh trays are generally similar in structure, they can vary based on:

- **Material:** Commonly made from galvanized steel, stainless steel, or aluminum, depending on environmental conditions and corrosion resistance requirements .
- **Finish:** Options include powder-coated or PVC-coated trays for additional protection in humid or corrosive environments .
- **Size and Span:** Mesh trays come in various widths and depths to accommodate different cable volumes and can be cut or joined to fit specific layouts .
- **Load Capacity:** Designed primarily for lightweight cables, they are not intended for heavy power cables but excel in supporting low-voltage, fiber optic, and communication cables .
