

No internet access when connected to the fiber optic router

Summary of Content

If your device connects to a fiber optic router but has no internet, the issue is often due to router, converter, or network configuration problems, which can usually be resolved with systematic troubleshooting.

Check Hardware and Connections

Ensure all cables are securely connected: the fiber wall box to the GPON converter, and the converter to your router. Inspect the fiber patch cord for bends or damage, as fiber cables are delicate and can disrupt the signal if mishandled. Verify that the LAN cable from the router's WAN port to the converter or wall socket is properly seated. Check the indicator lights on your router and converter; a solid or blinking green light usually indicates proper connectivity, while yellow or red may signal a problem.

Restart Your Equipment

Power-cycle your network devices. Turn off your personal router, the ISP's modem/router, and the GPON converter. Wait at least 10-30 seconds, then turn them back on, allowing 2-5 minutes for all devices to boot and establish a connection. This clears temporary glitches and refreshes the connection to your ISP.

Verify Network Settings
