

ODF patch panel structure

Overview

ODF, also known as optical distribution frame or fiber optic patch panel, is a critical device used in optical communication for managing and distributing optical fibers. 3-E scope. ODFs are robust enclosures (often wall-mounted or free-standing racks) designed to protect delicate splices and terminations from dust, physical damage, and excessive bending. As data centers, enterprises, telecom operators, and smart-building infrastructures deploy increasingly dense fiber links, ODFs provide the structured. A fiber optic patch panel (also known as fiber distribution panel, fiber patch bay, optical patch panel, or fiber termination panel) is a modular, rack-mountable unit designed for high-density fiber termination, organization, and cross-connection in structured cabling environments.
